University of Oxford

$$P_{\text{pv}} = A_{\text{pv}} G_{\text{tot}} \eta_{\text{cell}}$$

$$\frac{\eta_{\text{cell}}}{\eta_{\text{ref}}} = \left[1 - \beta (T_{\text{cell}} - T_{\text{ref}}) \right] \left(1 + \frac{k_{\text{B}} T_{\text{cell}}}{e} \frac{\ln X}{V_{\text{oc}}} \right)$$

For crystalline silicon, $\beta = 0.0045 \text{ K}^{-1}$

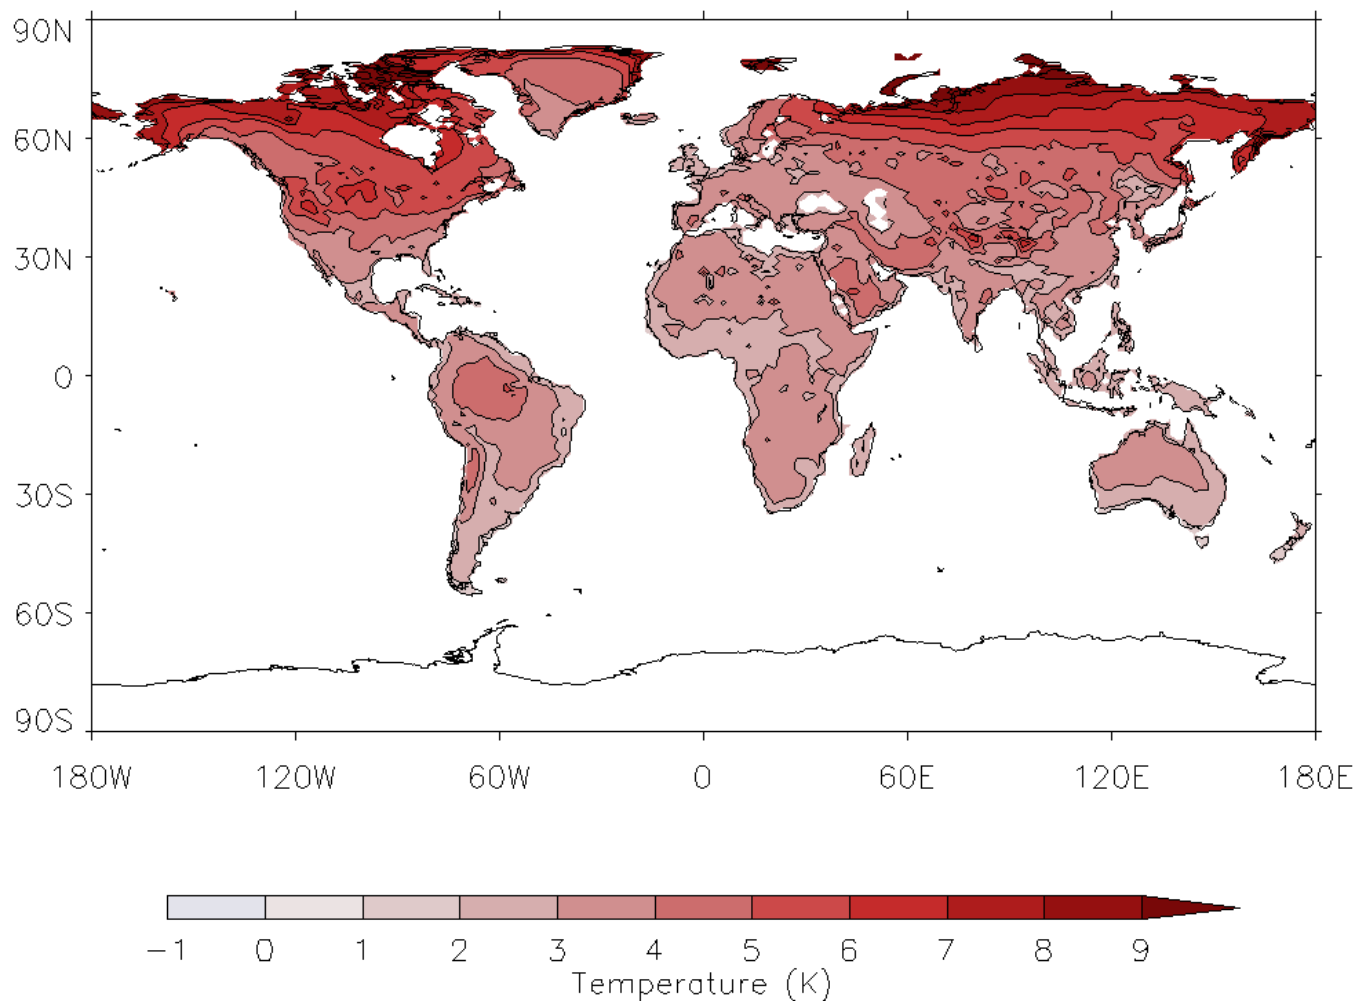

Assuming a horizontal panel

Climate change Temperature

UNIVERSITY OF LEEDS

10-year mean centred on 2080. Baseline: 1980 to 1999 mean.

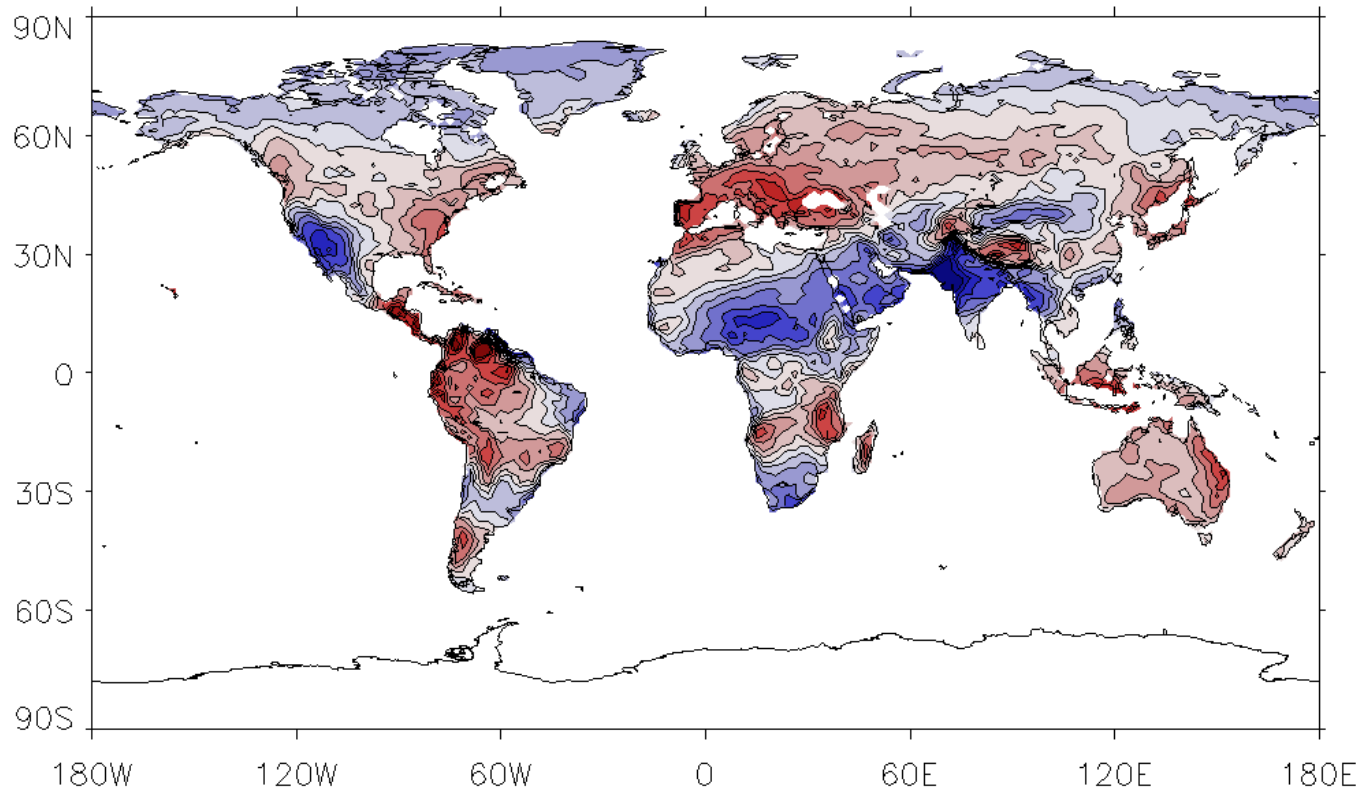

Climate change Direct insolation

UNIVERSITY OF LEEDS

10-year mean centred on 2080. Baseline: 1980 to 1999 mean.

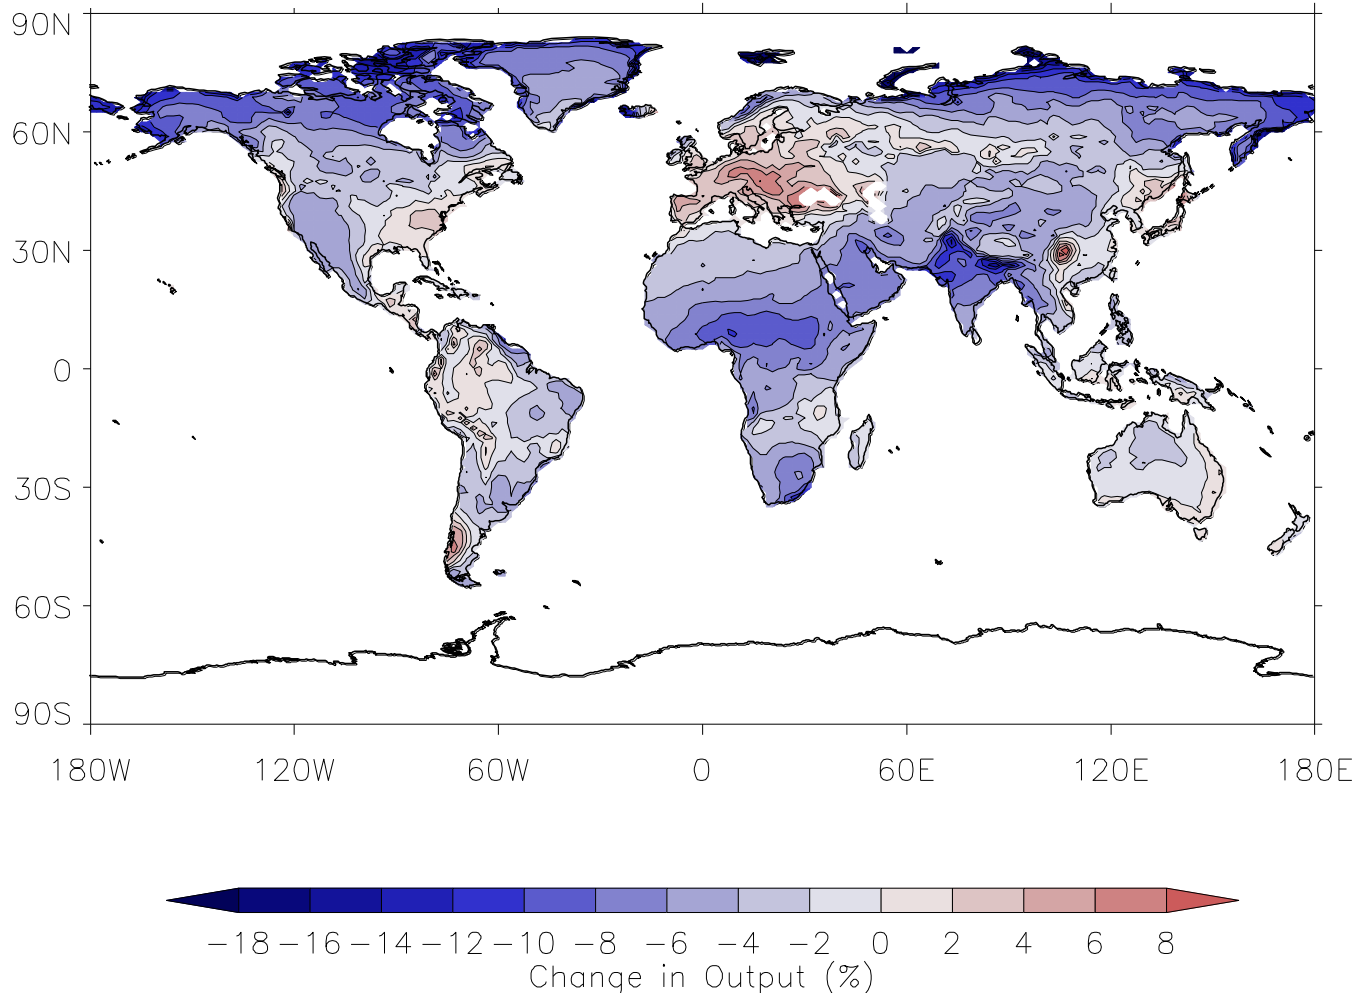

Impact Temperature and insolation

UNIVERSITY OF LEEDS

10-year mean centred on 2080. Baseline: 1980 to 1999 mean.

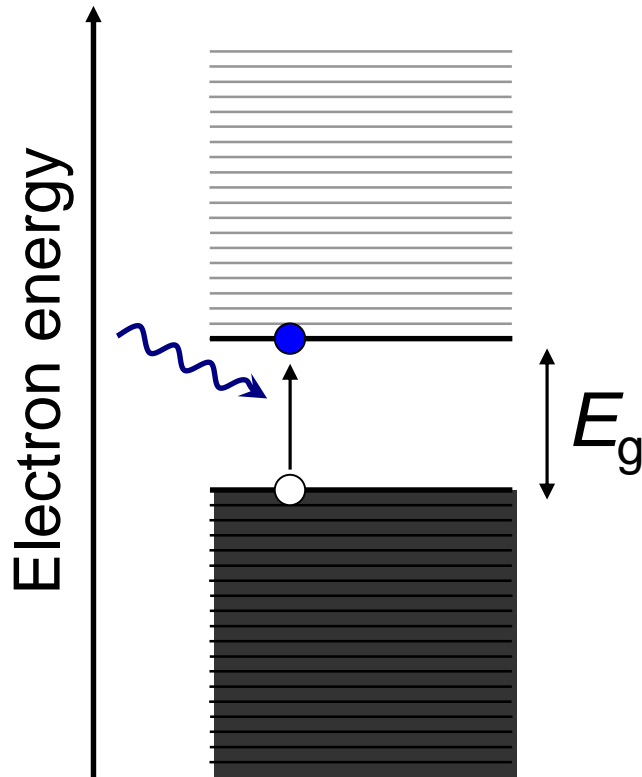

$\Delta E_{PV} / E_{PV(2010)}$	
California	-2.7%
Nevada	-4.0%
Spain	2.4%
UK	1.2%
Algeria	-1.5%
Germany	3.2%
Saudi Arabia	-5.5%
China	3.0%
Australia	-1.1%

Solar technology

Spectral irradiance

UNIVERSITY OF LEEDS

$$\lambda_{\text{photon}} = \frac{hc}{E_{\text{photon}}}$$

Solar technology

Spectral irradiance

UNIVERSITY OF LEEDS

10 mm
water vapour

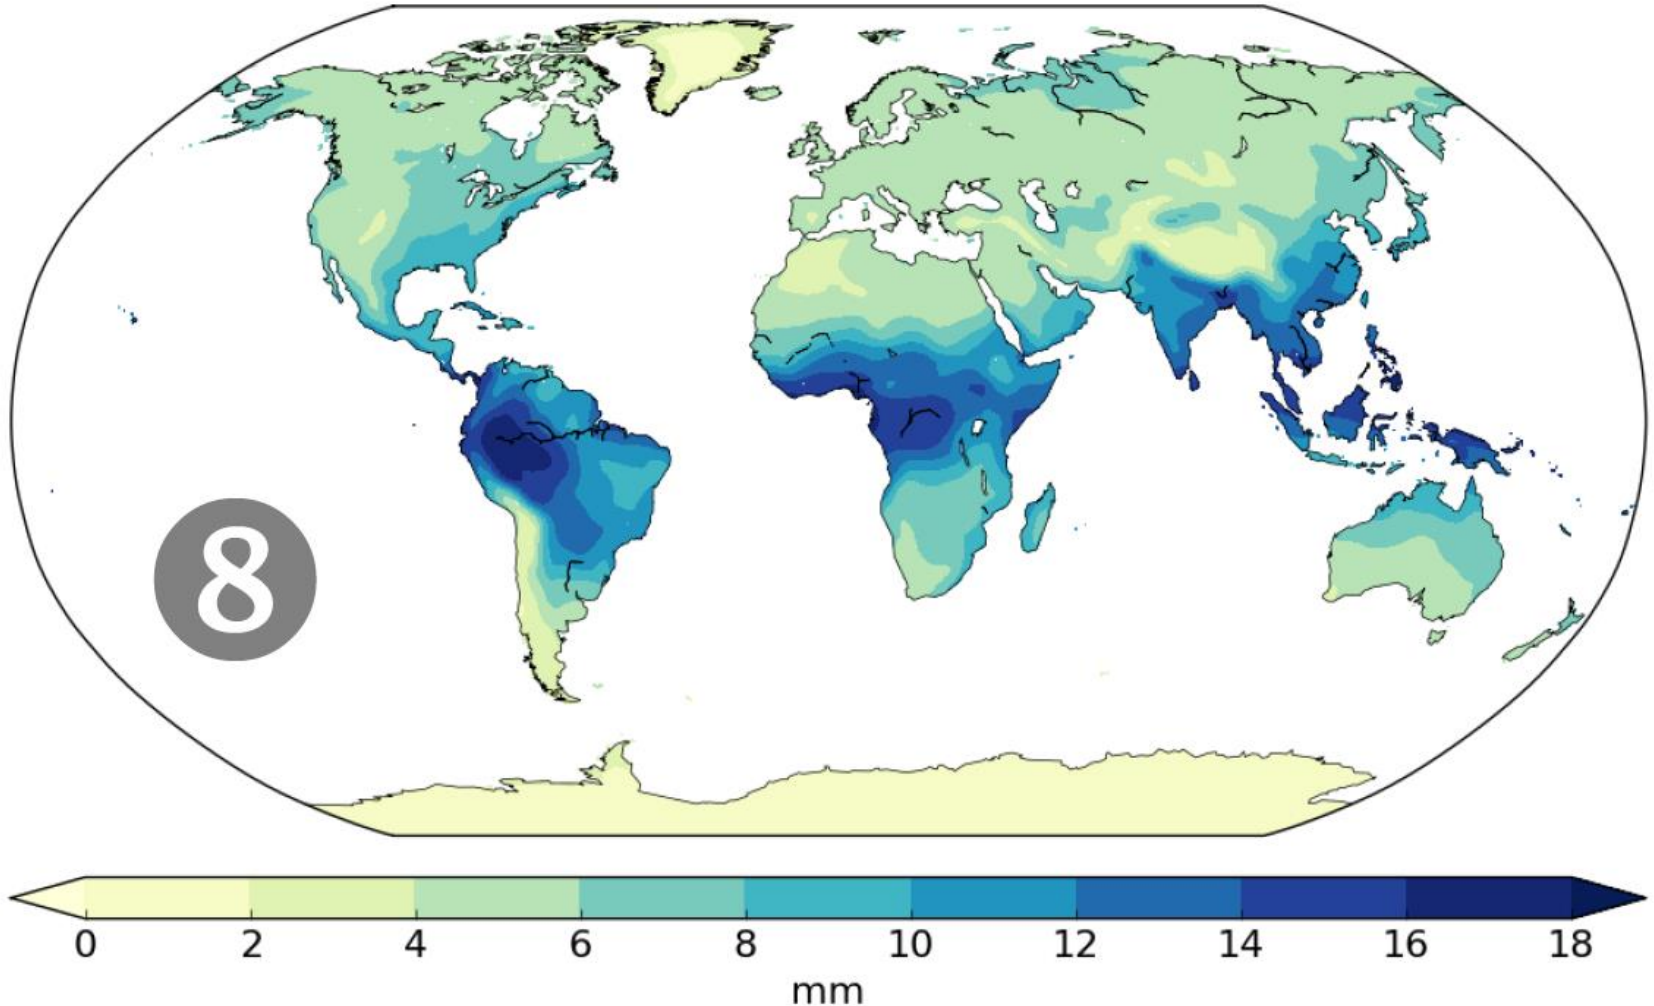

CJ Smith, R Crook, P Forster,
EU PVSEC, 2102 (2015).

Climate change Water vapour

UNIVERSITY OF LEEDS

10-year mean centred on 2090. Baseline: 1985 to 2005 mean.

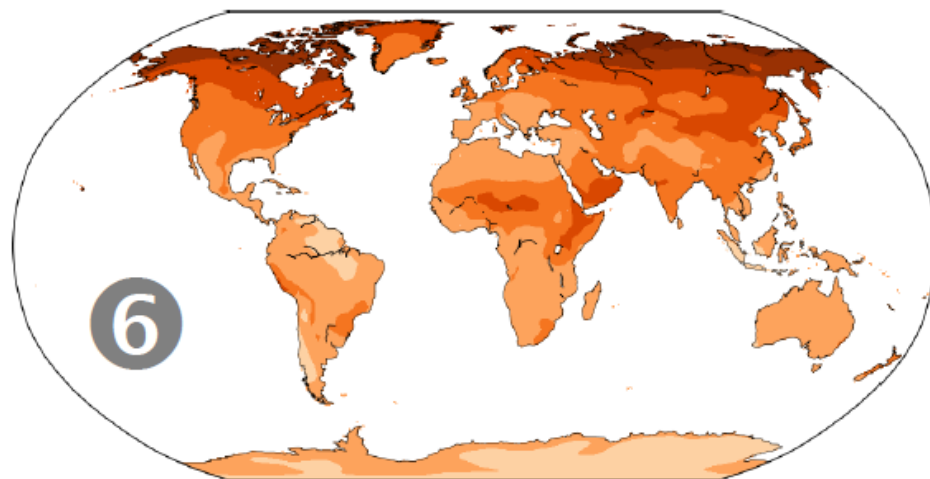

CJ Smith, R Crook, P Forster, EU PVSEC, 2102 (2015).

Impact Water vapour

UNIVERSITY OF LEEDS

Change in output (%)

10-year mean centred on 2090.
Baseline: 1985 to 2005 mean.

c-Si, $E_g = 1.12$ eV

a-Si, $E_g = 1.7$ eV

CJ Smith, R Crook, P Forster,
EU PVSEC, 2102 (2015).

Solar technology

Direct and diffuse irradiance

UNIVERSITY OF LEEDS

Only direct sunlight can be focussed.

Solar technology

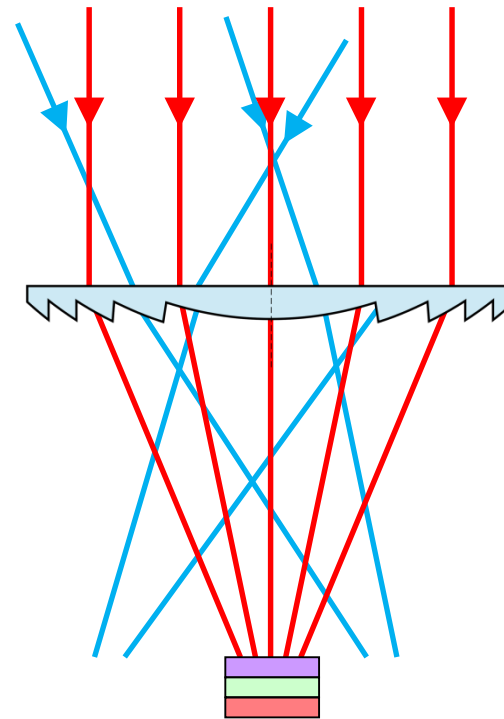

Direct and diffuse irradiance

UNIVERSITY OF LEEDS

Flat panel technologies

CPV

CSP

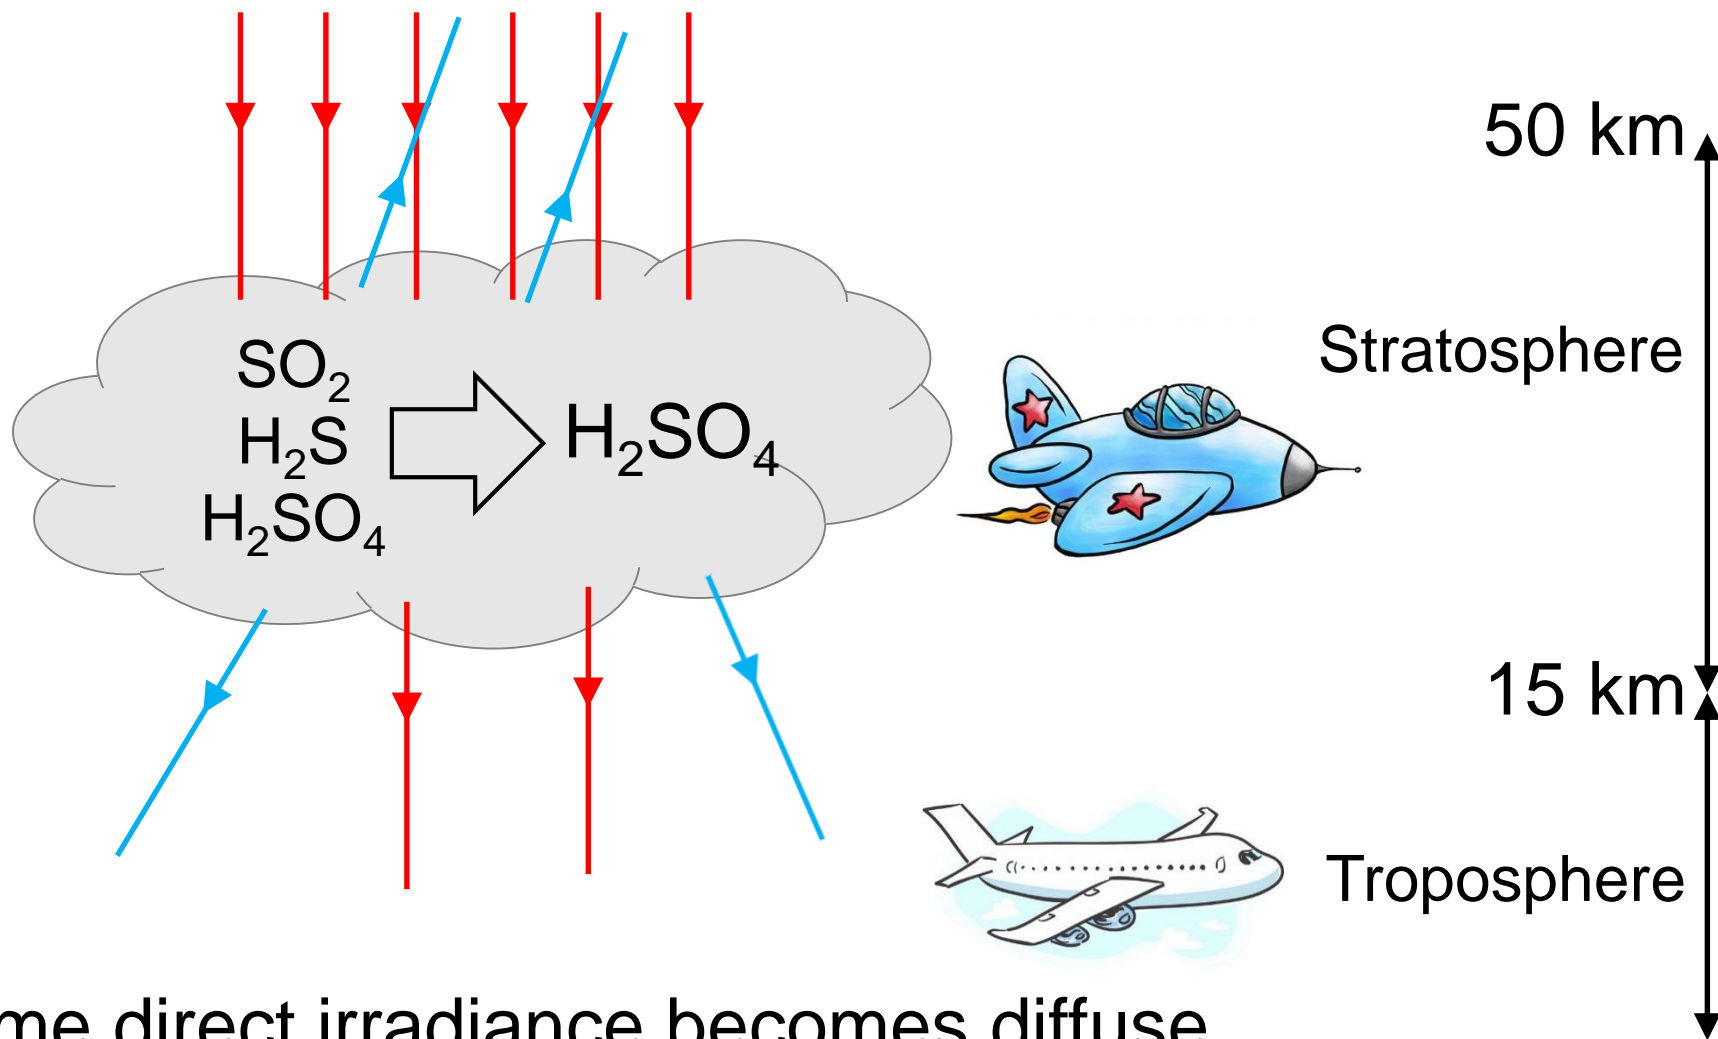

Concentrating technologies

Climate change

Stratospheric aerosols

UNIVERSITY OF LEEDS

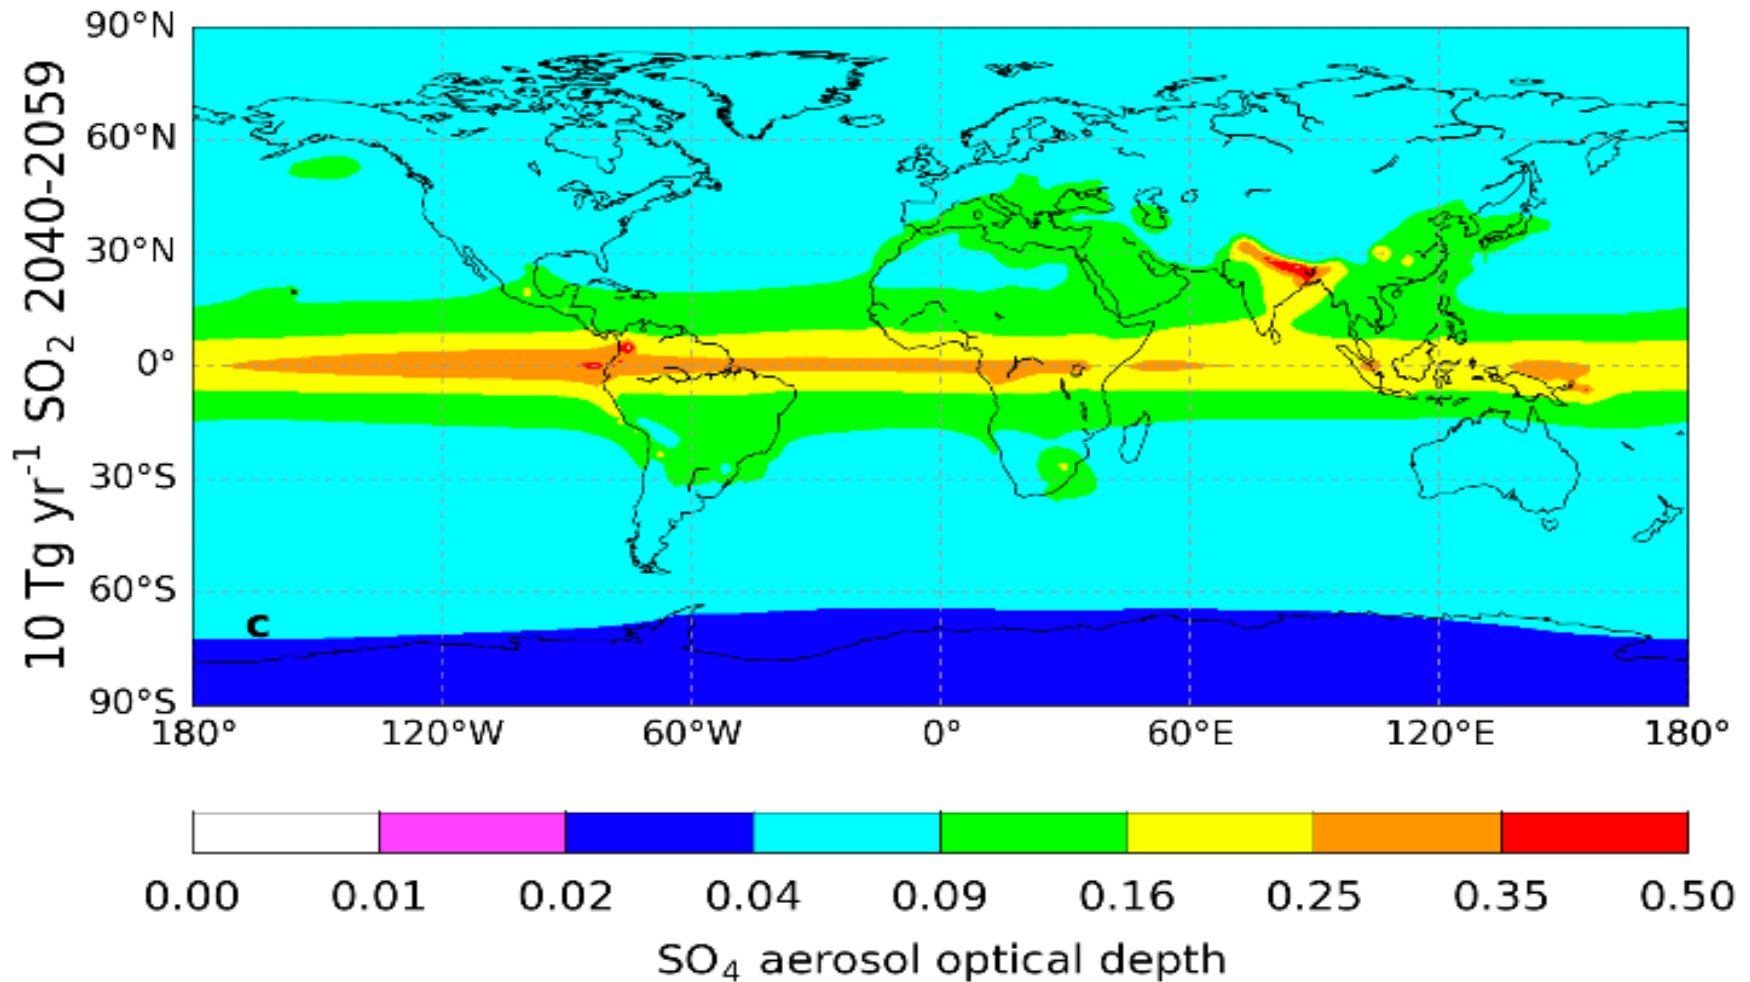

Some direct irradiance becomes diffuse

Climate change Stratospheric SO₂ injection

UNIVERSITY OF LEEDS

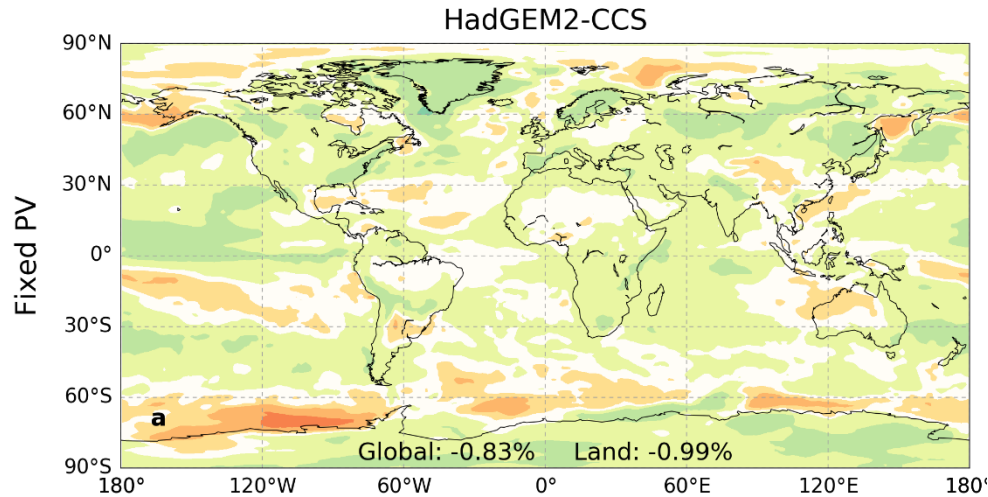

CJ Smith et al., submitted for publication.

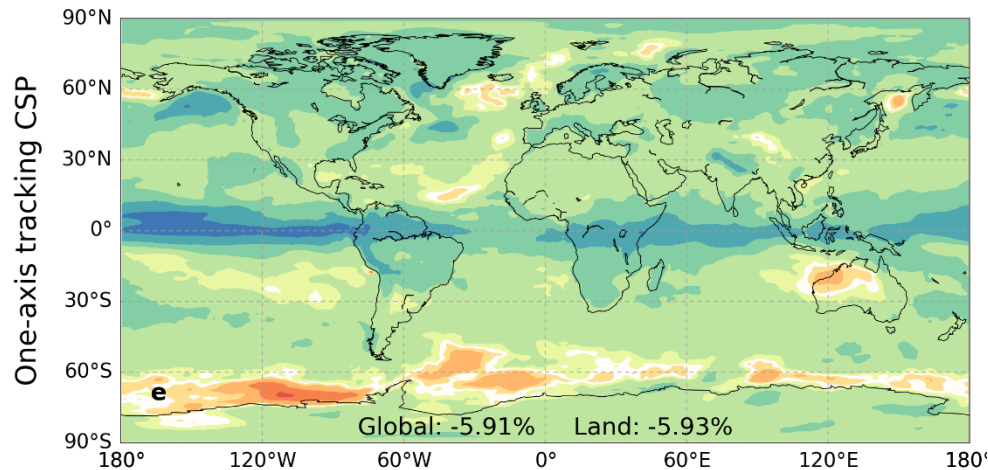

Impact Stratospheric SO₂ injection

UNIVERSITY OF LEEDS

Fixed-angle flat-panel PV

Concentrating solar power
(CSP)

% energy difference between geoengineering and RCP4.5 scenarios

CJ Smith et al., submitted for publication.

Climate change

temperature }
irradiance }

-5% to +3% (PV)

-5% to +10% (CSP)

water vapour

-3% to -1% (Si-PV)

Stratospheric SO₂ injection

flat-panel PV

-4% to +1%

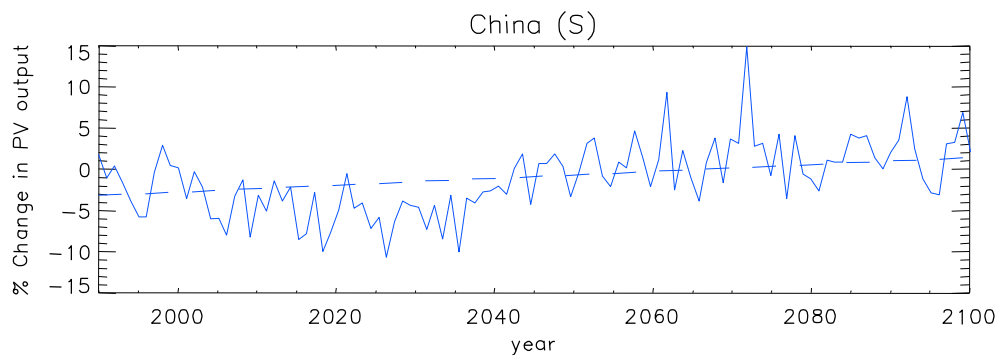

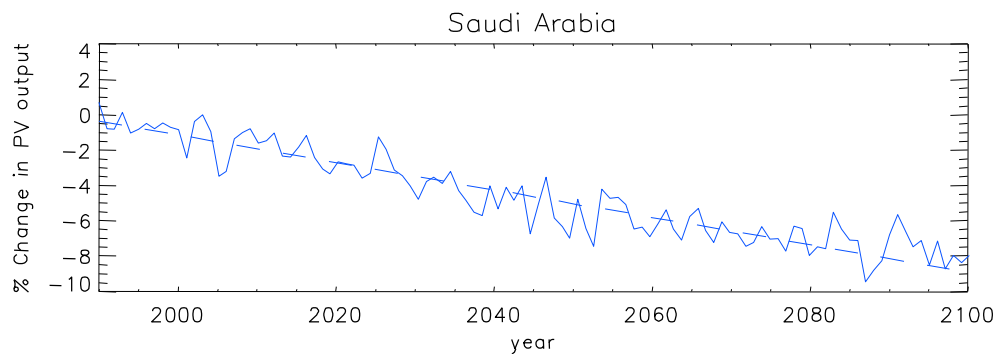

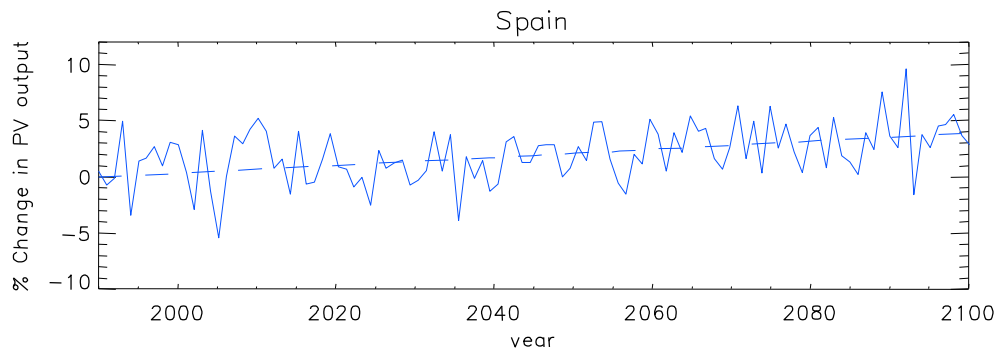

CSP

-15% to +4%

% change in PV output

UNIVERSITY OF LEEDS

Best fit linear curve
Baseline: 1980 to 1999 mean

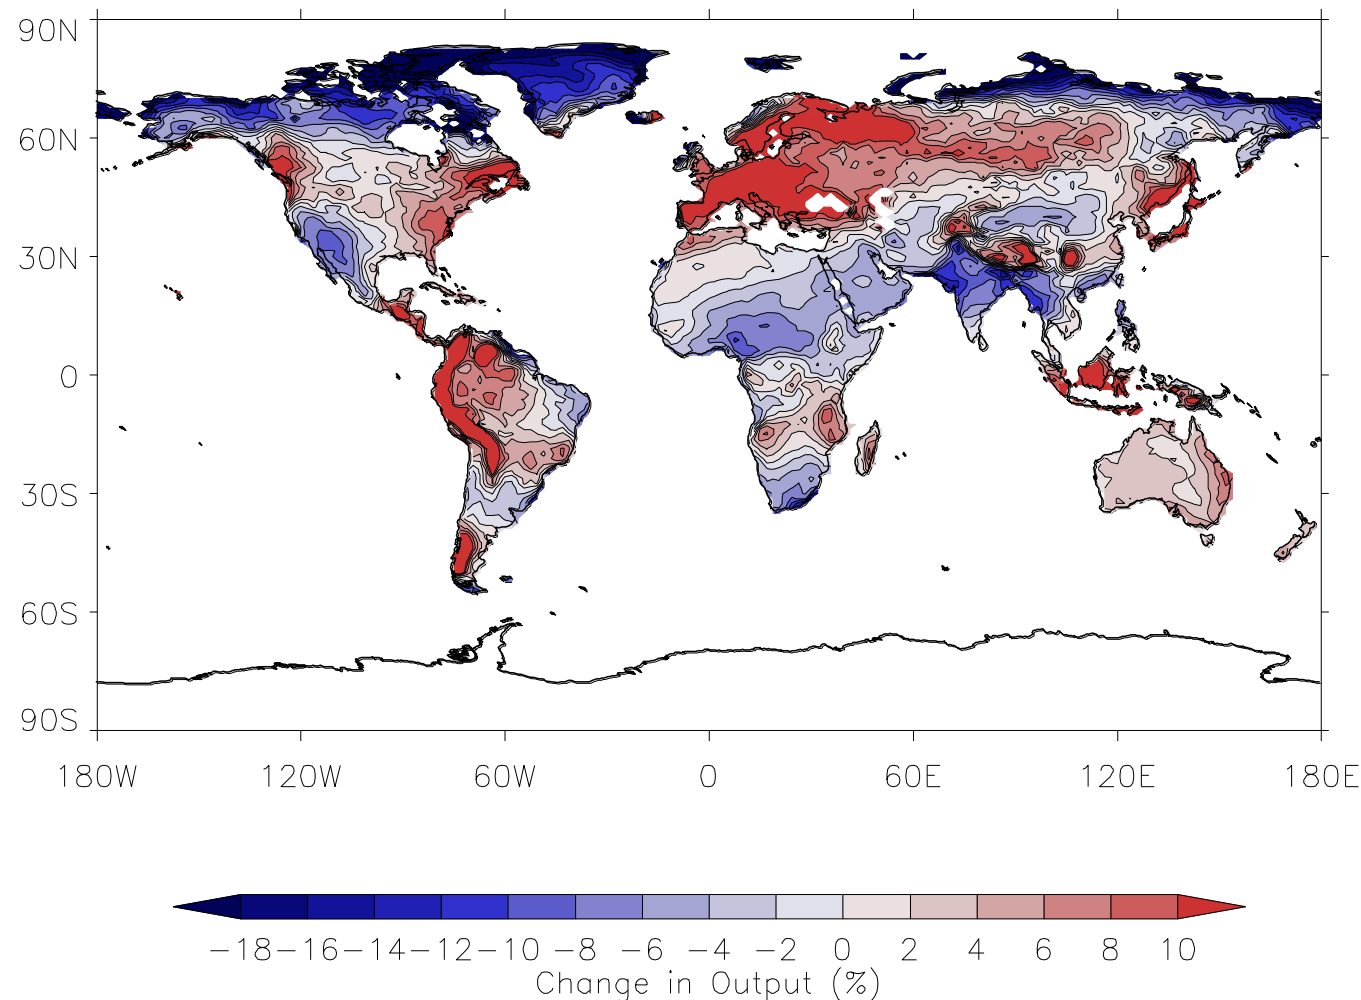

% change in output (CPV)

UNIVERSITY OF LEEDS

10-year mean centred on 2080. Baseline: 1980 to 1999 mean.

$\Delta E_{\text{CPV}} / E_{\text{CPV}(2010)}$	
California	-3.5%
Nevada	-4.9%
Spain	8.7%
UK	5.5%
Algeria	2.8%
Germany	10.0%
Saudi Arabia	-4.4%
China	4.7%
Australia	2.0%

Fractional contributions (PV)

UNIVERSITY OF LEEDS

Fractional contributions (CPV)

UNIVERSITY OF LEEDS

Uncertainty

UNIVERSITY OF LEEDS

Uncertainty in scenario
Uncertainty from model

Uncertainty in temperature
Uncertainty in insolation

Uncertainty in PV output
Uncertainty in CPV output

Temperature $\pm 0.8^{\circ}\text{C}$

PV output $\pm 0.5\%$
CPV output $\pm 0.1\%$

Change in cloud amount:
Good agreement in Europe,
Saudi Arabia, and Australia.
Poor agreement in America.
